Introduction to Computer Security

Discussion 8

Question 1 Cross-site not scripting

Consider a simple web messaging service. You receive messages from other users. The page shows all messages sent to you. Its HTML looks like this:

Mallory: Do you have time for a conference call? Steam: Your account verification code is 86423 Mallory: Where are you? This is important!!!

Steam: Thank you for your purchase

The user is off buying video games from Steam, while Mallory is trying to get ahold of them.

Users can include **arbitrary HTML code** messages and it will be concatenated into the page, **unsanitized**. Sounds crazy, doesn't it? However, they have a magical technique that prevents *any* JavaScript code from running. Period.

Q1.1 Discuss what an attacker could do to snoop on another user's messages. What specially crafted

		sent to steal this us			
2 Keeping in magainst it?	nind the attack you	constructed in the	previous part, wha	at is a defense that c	an prev

Question 2 Second-order linear... err I mean SQL injection

Alice likes to use a startup, NotAmazon, to do her online shopping. Whenever she adds an item to her cart, a POST request containing the field item is made. On receiving such a request, NotAmazon executes the following statement:

Each item in the cart is stored as a separate row in the cart table.

•	e can make to ca	use the Cart_au	a statement t
	ancake mix to her cart.	•	t . Describe a POST request she can make to cause the cart_ade incake mix to her cart.

Q2.1 Alice is in desperate need of some pancake mix, but the website blocks her from adding more than

When a user visits their cart, NotAmazon populates the webpage with links to the items. If a user only has one item in their cart, NotAmazon optimizes the query (avoiding joins) by doing the following:

After part(a), Alice recognizes a great business opportunity and begins reselling all of NotAmazon's pancake mix at inflated prices. In a panic, NotAmazon fixes the vulnerability by parameterizing the cart_add statement.

Q2.2	Alice claims that parameterizing the cart_add statement won't stop her pancake mix trafficking
	empire. Describe how she can still add 100 bags of pancake mix to her cart. Assume that NotAmazon
	checks that sessionToken is valid before executing any queries involving it.

Question 3 Clickjacking

In this question we'll investigate some of the click-jacking methods that have been used to target smartphone users.

Q3.1 In many smartphone browsers, the address bar containing the page's URL can be hidden when the user scrolls. What types of problems can this cause?

Q3.2 Smartphone users are used to notifications popping up over their browsers as texts and calls arrive. How can attackers use this to their advantage?

Q3.3 QR codes are used for various wide-ranging applications, for example: ordering at a restaurant, or providing a job link at a career fair. Can you think of any security vulnerabilities that might exist with the widespread use of QR codes?
